#### **DETAILED ACTION**

## **Drawings**

1. Figure 4 should be designated by a legend such as --Prior Art-- because only that which is old is illustrated. See MPEP § 608.02(g). Corrected drawings in compliance with 37 CFR 1.121(d) are required in reply to the Office action to avoid abandonment of the application. The replacement sheet(s) should be labeled "Replacement Sheet" in the page header (as per 37 CFR 1.84(c)) so as not to obstruct any portion of the drawing figures. If the changes are not accepted by the examiner, the applicant will be notified and informed of any required corrective action in the next Office action. The objection to the drawings will not be held in abeyance.

## Specification

2. The disclosure is objected to because of the following informalities: in lines 21-25 on page 9 the recitation of "Where, the discharge pressure acting to transmission rod 10 of valve element 9 acts to almost the same areas of the upper and lower portions in the figure and these pressured acted to those portions are canceled by each other, and as a result, the discharge pressure almost does not act in the axial direction of the valve element" is unclear.

Appropriate correction is required.

## Claim Rejections - 35 USC § 102

3. The following is a quotation of the appropriate paragraphs of 35 U.S.C. 102 that form the basis for the rejections under this section made in this Office action:

A person shall be entitled to a patent unless -

- (a) the invention was known or used by others in this country, or patented or described in a printed publication in this or a foreign country, before the invention thereof by the applicant for a patent.
- 4. Claims 1-4 are rejected under 35 U.S.C. 102(a) as being anticipated by Kimura 2001/0003573 now US Patent 6,481,976. Kimura teaches all the limitations as substantially

Art Unit: 3746

claimed for a control valve for a variable displacement compressor, figure 1, including: a displacement control valve 34 disposed at a position in a discharge pressure supply passageway 33 capable of communicating with a crank chamber 15 from a discharge chamber 23, a fixed orifice, the valve seat defined by element 59, provided at a position in a pressure relief passageway 58 communicating with a suction chamber 22 from said crank chamber 15, said displacement control valve 34 being controlled in opening/closing operation to regulate a pressure in said crank chamber 15 to control a piston stroke (¶0052-0053), a pressure sensing member 49 being expanded and contracted by sensing a pressure in said suction chamber 22 or said crank chamber 15, a valve element 43 one end, 43a of 43, of which is brought into contact with said pressure sensing member 51 and has a valve part 43c opening and closing a valve hole, the valve seat defined by element 55, formed in said discharge pressure supply passageway, 46 of 33, in response to an expansion/contraction of said pressure sensing member 51, a valve chamber 47 in which said valve part 43c is disposed and to which a pressure in said crank chamber 15 acts, via element 53, a partition wall, as shown in figure 1 or 7, disposed around said valve element 43 at a position in an axial direction of said valve element 43, a pressure chamber, area between elements 44 and 59 as shown in figure 4, partitioned from said valve chamber 47 by said partition wall, partition defined by valve seat of element 59, and to which a pressure in said suction chamber 22 acts, via element 58, and a solenoid 42 provided to the other end, 43d of element 43, of said valve element 43 and capable of controlling an opening degree of said valve part 43c by an increase/decrease of an electromagnetic force (90083-0084), and a flow passage from said valve chamber 47 to said pressure chamber, area between elements 44 and 59 as shown in figure 4, formed in a portion disposed with said partition wall 59, whereby a gap, area created by bore constituting element

Art Unit: 3746

47, inner circumference of element 59, and outer circumference of element 43, is defined for forming a non-contact structure which does not give a sliding resistance relative to a movement of said valve element 43 in its axial direction; and a gap, area created by bore constituting element 47 and inner circumference of element 59, forming the fixed orifice, figure 4; a partition wall 59 fixed at a valve casing side 41 of the displacement control valve 34, and the gap, area created by bore constituting element 47 and inner circumference of element 59, is defined between an inner circumferential surface of the partition wall 59 and an outer circumferential surface of the valve element 43. Further in a third embodiment, as shown in figure 8, Kimura '573 teaches a valve for a variable displacement compressor having a partition wall 44b is fixed to the valve element 43, and the gap is defined between an outer circumferential surface of the partition wall 44b and an inner circumferential surface of a valve casing, 47 (Lower Region) of element 41 as shown in figure 8, of the displacement control valve 34.

# Claim Rejections - 35 USC § 103

- 5. The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:
  - (a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negatived by the manner in which the invention was made.
- 6. The factual inquiries set forth in *Graham* **v.** *John Deere Co.*, 383 U.S. 1, 148 USPQ 459 (1966), that are applied for establishing a background for determining obviousness under 35 U.S.C. 103(a) are summarized as follows:
  - 1. Determining the scope and contents of the prior art.
  - 2. Ascertaining the differences between the prior art and the claims at issue.
  - 3. Resolving the level of ordinary skill in the pertinent art.

Application/Control Number: 10/510,342

Art Unit: 3746

4. Considering objective evidence present in the application indicating obviousness or nonobviousness.

Page 5

7. Claim 5 is rejected under 35 U.S.C. 103(a) as being unpatentable over Kimura et al. 2001/0003573 in view of Taguchi 5,332,365. Kimura teaches the invention as discussed and a control valve for a variable displacement compressor including a solenoid 42 having an electromagnetic coil 65 excited for generating an electromagnetic force, an iron core 44 for generating a magnetic force by excitation of said electromagnetic coil 65, a plunger 62 attracted and moved towards an iron core side 44c by the magnetic force of the iron core 44, and an end of a valve element, 43e of element 43, being fixed to said plunger 62 which is held slidably in an axial direction of the valve element 43. Kimura fails to teach the claimed limitation that is taught by Taguchi for a control valve for a variable displacement compressor wherein a plunger 451 is attracted to a fixed iron core 412 due to a magnetic force, and a gap 412a defined between a fixed iron core 412 and a valve element 460 forming a non-contact structure which does not give a sliding resistance relative to a movement of the valve element 460 in its axial direction. The end of the valve element 460 is a non-magnetic component, element 484, that is in integral communication with the main valve element, rod 481, of the control valve taught by Taguchi. It would have been obvious to one of ordinary skill in the art at the time the invention was made to modify the iron core 44 of Kimura to be a non-magnetic plunger connected to a valve element 43 and modify the solenoid to have a fixed iron core in between a plunger connected to an upper portion of the valve element and a plunger connected to the lower end of the valve element to provide a control valve that can quickly reduce a pressure in a crank chamber of a variable displacement compressor without damaging the internal components of a variable displacement compressor (Taguchi col. 3 II. 64-68).

Application/Control Number: 10/510,342

Art Unit: 3746

#### Conclusion

8. The prior art made of record and not relied upon is considered pertinent to applicant's disclosure are cited on form 892 herewith.

Any inquiry concerning this communication or earlier communications from the examiner should be directed to Leonard J. Weinstein whose telephone number is 571-272-9961. The examiner can normally be reached on Monday - Thursday 7:00 - 5:30.

If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, Anthony Stashick can be reached on 571-272-4561. The fax phone number for the organization where this application or proceeding is assigned is 571-273-8300.

Information regarding the status of an application may be obtained from the Patent Application Information Retrieval (PAIR) system. Status information for published applications may be obtained from either Private PAIR or Public PAIR. Status information for unpublished applications is available through Private PAIR only. For more information about the PAIR system, see http://pair-direct.uspto.gov. Should you have questions on access to the Private PAIR system, contact the Electronic Business Center (EBC) at 866-217-9197 (toll-free). If you would like assistance from a USPTO Customer Service Representative or access to the automated information system, call 800-786-9199 (IN USA OR CANADA) or 571-272-1000.
